

Humanoid Robots in Austrian Intralogistics: A Cost Decision Memo

Executive Summary

Rafael Braga

2026-07-16

Recommendation

Act now: size the crew to S-lean-human (three people, $\rho \leq 0.85$ after pick-lines scaling). At €647K in five-year present-value cost, it is the least-cost modeled capacity-feasible option. **For robot-inclusive alternatives:** S-future-2028 is lowest at €2.533M, but remains costlier than the human baseline. Do not approve procurement solely on wage-arbitrage assumptions; local vacancies and warehouse telemetry are the decision-critical validation inputs.

Decision at a glance

Scenario	5-year NPV	Total-cost reduction vs baseline (NPV)	Decision
S-lean-human	-€647K	62.5%	Implement now
S-baseline-human	-€1.726M	0.0%	Legacy reference
S-future-2028	-€2.533M	-46.7%	Lowest-cost robot case
S-pure-humanoid	-€2.878M	-66.7%	Not preferred
S-hybrid-amr	-€3.841M	-122.5%	Integration burden

All values come from `tco_scenarios.csv`. They are cost NPVs, so a less-negative number represents lower cost.

Scope and evidence

The project combines 2,359 publicly available UnifoLM demonstration episodes, a SimPy AutoStore model, and a five-year TCO model using Austrian labor inputs. The data are household demonstrations rather than warehouse tasks; the model therefore applies a 0.50–0.90 WBT-to-production transfer factor.

Method

1. Capability extraction summarizes cycle-time evidence.
2. Discrete-event simulation checks operational feasibility.
3. The financial model calculates capex, recurring operating costs, residual value, and the five-year cost NPV.
4. OAT, paired Monte Carlo (common random numbers), and two-way frontiers test sensitivity without changing scenario identity.

Key limitations

Availability derating, wage growth, system integration (€200K for robot scenarios), and residual value are modeled. They are assumptions, not measurements. The published frontiers do not identify a S-future-2028 / S-lean-human cost tie within the €60K–€180K humanoid-capex grid. A local pilot should replace the transfer proxy before a capital commitment.
